

## > IMPORTANT SUPPLIER TO PULP INDUSTRY

Paper pulp is made in a highly corrosive environment. Stainless steels and, in particular, duplex or super duplex stainless steels offer great advantages here.

Deform is vastly experienced in the above materials and is recognised for its industry-leading expertise in cold and hot forming. We are also famous for carrying out all the associated cutting, plate working, surface treatment and welding operations needed for perfect results.

We are happy to be involved in our customers' processes at an early stage. Our design know-how often enables money to be saved through weight reductions and minimal welding.

Deform can deliver parts for final assembly by the customer. If the customer wishes, we can also supply complete, welded assemblies.

Our long and impressive reference list includes end customers all around the world.

▲  
◀ Pre-assembled or welded in parts - the requirements from our customer decides!

▲  
Deform has made a large number of pressure vessel heads to pulp digesters worldwide. The biggest so far is a head of Ø13200x46,5 mm (1.4462). It was made of 20 petals and 8 crown parts. Above impressive fit at the pre-assembly!
